Now, even if you are in a rush, you can use the best program on the market!Q: How to list all the Users in Active Directory through Azure AD Graph? I would like to create a web service that receives username, password and the mail adress, and returns a list of users, including mail adress. I am trying to do it through Graph API through the Azure Active Directory. Does anyone know how to do it? I found this link but it is not exactly what I am looking for. This is my code: public static async Task> GetUsers() { var token = UserToken.GetCredential(""); var userManager = new UserManager(token); var user = await userManager.FindByNameAsync("username"); return new List() { user.DisplayName } } The response: "code": "Request_BadRequest", "message": "The request is not well formed: The query parameter 'api-version' is missing.", "innerError": { "request-id": "0edeb41f-962c-4b86-84a7-a7fa7ce57189", "date": "2019-04-12T05:53:48" } A: A number of things may be going wrong here. You are not passing the correct parameters to the API; the api-version (and api-key) parameters are missing. You're also missing the required per-user permissions in your App registration (the resource "AzureAD: Read directory data" is what you're missing), and you're not using Azure AD properly. But also, as it's not working, it means that you're not using a valid token for the Azure AD 82157476af
